

Master of Science in Conservation Medicine

*Do you have a passion for animal, human and environmental health?
Are you driven to make a positive impact on the world we share?*

The continued emergence of new diseases from wild animals, the effects of human activities on endangered species, and the impact of climate change on biodiversity are just a few of the topics examined throughout the Master of Science in Conservation Medicine Program.

Conservation Medicine uses a One Health approach to addressing urgent

issues facing our planet, including emerging and resurging diseases, habitat use conflicts, environmental contamination, ecosystem and climate change, biodiversity loss, and ecosystem function degradation. These problems transcend the usual boundaries of conservation biology, veterinary medicine, public health, and environmental health.

Interdisciplinary in nature, Cummings School's Master of Science in Conservation Medicine focuses on health relationships occurring at the interfaces of humans, animals, and the environment. This program equips students from diverse backgrounds with the expertise and collaborative skills to work with other professionals, scientists, policy-makers, and local communities to develop and implement solutions for global issues and other important health-related challenges.

Cummings School
of Veterinary Medicine

Healing Animals. Helping Humans. Transforming Global Health.
