Veterinary Medicine

Master of Science in Conservation Medicine

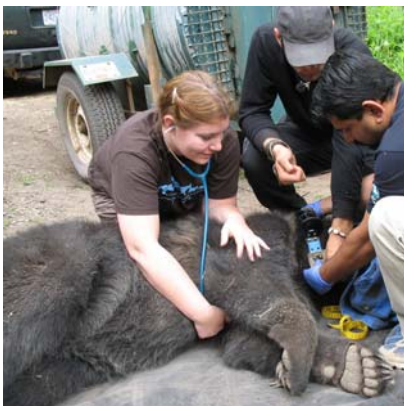

The continued emergence of new diseases from wild animals, the effects of human activities on endangered species, and the impact of climate change on biodiversity are just a few of the topics that are examined in a novel **Master of Science in Conservation Medicine** program.

We have set aside time in January and February, 2013 for prospective students to visit, discuss the program, and get their questions answered by the MCM Program Director, Dr. Alison Robbins, MS, DVM. If you are unable to travel to the Grafton, MA campus, we can schedule a phone conversation.

The following dates are available:
Friday, January 18, 2013
Friday, February 8, 2013
Please contact mcm@tufts.edu in order to schedule a time

Conservation medicine focuses on health relationships occurring at the interface of humans, animals, and the environment, and seeks to develop and apply health management practices, policies and programs that sustain biodiversity and protect the ecosystems essential to animal and human health.

Since many disciplines are involved in conservation medicine, the program seeks a diversity of backgrounds, including: natural and social scientists, engineers, public health and medical professionals, veterinarians, lawyers, policy and wildlife professionals, and others interested in applying their expertise to conservation medicine issues.
